Farm Drainage is the solution for getting **maximum yield** out of your high cost inputs.

*Don't know where to start? Let us help you – **BIG** or **SMALL**, we do them all.*

STEP 1: YOUR NEEDS

Why do I need Drainage?

Well, here are just a few good reasons drainage will save you time, money and increase productivity:

- Early planting for good root establishment before dryer weather patterns approach.
- Good early plant health means higher end yields.
- Allows complete planting & harvesting in a single trip to field. (Saves time and fuel)
- Can increase soybean yield 10-25%.
- Can increase corn yield 20-40%.

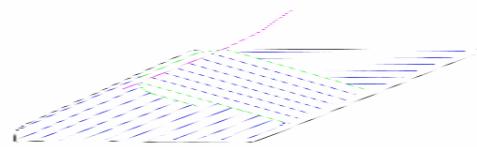

STEP 2: DESIGN

Let our experience design a drainage system that will meet your needs for generations to come.

Designs may be big or small but need to be laid out for future additions to the system.

Here are a few steps we will do for you:

- Pipe sizing for the acres to be drained.
- Proper grade for field designs of drainage systems.
- Proper layout for now and future additions.
- Professional installation with the latest GPS automated system.
- Full color GPS map of installed tile.

STEP 3: INSTALLATION

Let RGE install your system professionally so you get the most for your money.

Proper installation is the key to making your drainage system perform to its fullest potential. Reding's Gravel & Excavating uses the latest in GPS Guided Systems. Our pipe is installed with (AGPS) Pipe Pro System which automatically calculates the grade and depth of pipe then controls the machine during installation.
